GLOBAL URBAN HEAT

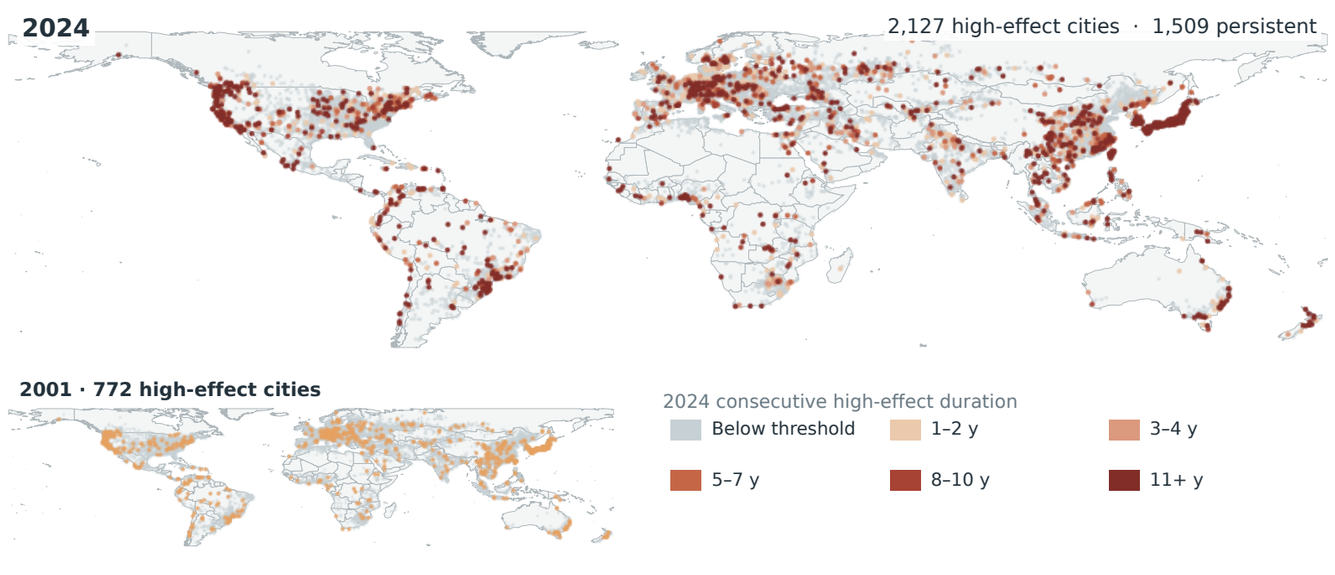

Persistent heat effects are spreading across cities and populations

9,713 cities / 2001–2024 observed / 2030 conditional extension

A What persistence means

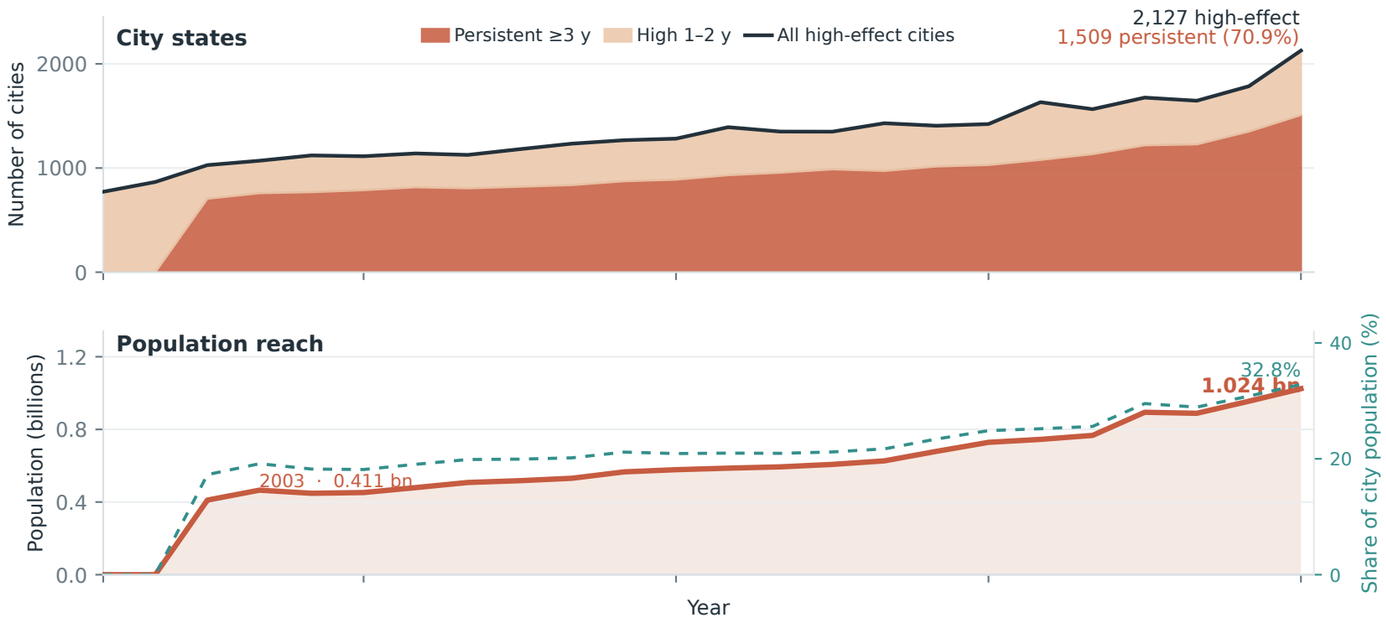

B The global geography of persistence

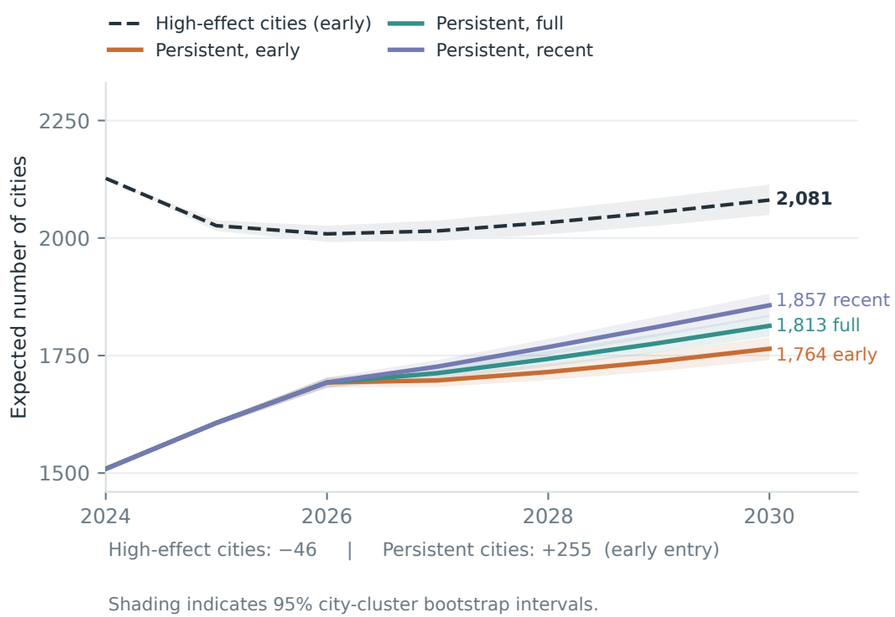

Every dot represents one study city; the 2020 city boundaries remain fixed through time.

C Historical expansion

D Conditional continuation to 2030

Shading indicates 95% city-cluster bootstrap intervals.

Fixed threshold: P90 of pooled 2001–2005 city-year UAH (1.426 °C); persistent state: ≥3 consecutive high years.

UAH threshold: pooled 2001–2005 P90; city observations: 2001–2024.
